Patent No. 6451979
GENERAL INFORMATION:
APPLICANT: Kaelin, William
APPLICANT: Greet, Christine
TITLE OF INVENTION: METHODS OF TREATMENT USING
TITLE OF INVENTION: NBS-1, ANTIBODIES AND PROTEINS THERETO, AND USES OF THE
TITLE OF INVENTION: ANTIBODIES
NUMBER OF SEQUENCES: 27
CORRESPONDENCE ADDRESS:
ADDRESSEE: Nixon Peabody LLP

GENERAL INFORMATION:

APPLICANT: Lane, David

APPLICANT: Bottger, Volker

APPLICANT: Bottger, Stephen

APPLICANT: Cartick

APPLICANT: Carcia-Echeveria, Carlos

APPLICANT: Puret, Pascal

TILLE OF INVENTION: Inhibitors of the Interaction of P53 and MDM2

FILE REFERENCE: 4-20937/A/PCT

CURRENT PLING DATE: 1999-03-26

PRIOR APPLICATION NUMBER: US/09/214,371B

CURRENT PLING DATE: 1999-03-26

PRIOR PLING DATE: 1999-03-26

PRIOR ELING DATE: 1999-07-04
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

This sequence is a peptide homologue of a region of p53 which binds to mand. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.
This sequence is a peptide homologue of a region of p53 which binds to mama. This peptide is used in the construction of a movel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells on or overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 tunction. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  p53; mdm2; inhibitor; therapy; activator; treatment; cancer; medicament.

This represents a p53 N-terminal peptide fragment used in an Elisa TIP assay for analysing the interaction between human oncogenic protein MDM2 can do p53. The invention provides peptide derivatives capable of binding to the human MDM2. These peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated cappetosis in tumour cells comprising a wild-type p53 and non-elevated compay and to identify and design inhibitors of MDM2, p53 binding. They can also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia conteractions, especially tumours and viral infections. The peptides can interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and caccumulation in normal cells. The peptides which mimic the MDM2 binding content in p53, have a significantly greater blocking activity compared content in wild-type p53.
                                                                                                                                                                                                                                                                                                                                      MDM2; oncogenic protein; p53; human; inhibition; interaction; cancer; tumour; diagnosis; binding; viral infection; Elisa TIP assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Compounds binding to MDW2 protein and inhibit its interaction with p53 - useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Boettger V, Chene P, Furet P, Garcia-echeverria C;

p53/RB interaction inhibiting peptide 6 (residues 11-29 of human p53).
                                                                                                                                                                                                                                                                                                                                                           Antibodies specific for p53 are detected by binding to immobilised fragments of the p53 gene product containing the antibody-binding region. Preferred fragments contain amino acids 1-241, 40-349, 40-393, 66-241, 66-393, 237-349, 237-393 and esp. 9-33, 37-52 or 368-386. See AAR51872-R51881 for sequences of these fragments.
                                                                                                                                                                                                                                      Non-radioactive detection of p53 specific antibodies - by capture on immobilised p53 or its fragments, then reaction with labelled second antibody, for diagnosis of tumours and suitable for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying compounds that modulate interaction of p53 and Rb protein - or those that bind to Rb protein, used to induce apoptosis, specifically for treatment of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Retinoblastoma gene; RB; p53 protein; interaction; inhibitor; tumour; apoptosis; modulator; medicine; veterinary; human.

This peptide fragment of p53 is an inhibitor of the interaction between a p53 protein and a retinoblastoma (RB) protein. This peptide corresponds to residues 11-29 of human p53 (AAW47079). The interaction between p53 and Rb is found to be critical for determining whether or not a cell enters apoptosis. Apoptosis is prevented if interaction occurs. The interaction is between regions 1-7 or 290-393 of p53 and region 379-928 of Rb. The invention provides methods to identify compounds able to modulate interaction or binding between p53 and Rb protein. The method comprises combining p53 and Rb, or their fragments, with a test compound and detecting interaction/binding between them. These inhibitory compounds are used in human or veterinary medicine to modulate p53 activity and processes, specifically for inducing apoptosis in tumor cells (possibly also in cells infected by virus), in vivo or in vitro. Expression of these modulators by gene therapy methods is also contemplated. Other activities that can be affected are transcription repression, d1 arrest, DNA repair, homologous recombination and 20-5-5- exomuclease activity. Modulation of interaction with Rb may also
                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This p53 biotinylated N-terminal peptide fragment is used in an Elisa P2 assay for analysing the interaction between human oncogenic protein MDM2 and p53. The invention provides peptide derivatives capable of binding to the human MDM2. These peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2 and to identify and design inhibitors of MDMM2, p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia interactions, especially tumours and viral infections. The peptides can be administered masally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and site in p53, have a significantly greater blocking activity compared with wild-type p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

p53 tumour suppressor protein and the MDM2 oncogene protein contain the peptide sequences AAR89911-3 which form part of the p53 protein identified by modifying the p53 consensus binding sequence by substitution of an Alanine at each pos. and identifying which amino acid changes altered binding to expressed MDM2. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                          New peptides of the invention which interfere with the binding of the

The present invention describes isolated prepared P53 epitopes (I). Also described are: (1) a cytotoxic T lymphocyte (CTL) that is cultured in vivo and binds to a complex of (1); (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids, (3) a vaccine composition comprising (II), a unit dose of a peptide with less sequence of p53, and a pharmaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) am isolated nucleic acid encoding (I); and (5) am isolated nucleic acid encoding (II). (I) as cytostatic activity and can be used in vaccines. The vaccine composition is useful for treating or preventing cancer. (I) and (II) are useful as diagnostic agents and for evaluating immune responses. Unlike conventional epitopes, immunosuppressive epitopes that may be
The present invention relates to assays and screening methods based on a direct interaction between fork head associated (FHA) domains and phosphorylated polypeptides, for characterizing the binding of these molecules. FHA peptides may be useful for treating medical conditions associated with defects in transcriptional control, DNA replication, DNA repair, cell cycle control or other cellular process. The method may provide valuable insights into checkpoint signalling, has important implications for the functions of other FHA domain-containing proteins and provides basis for new lines of therapy. The present sequence is a peptide used in the present invention.
                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Epitope-based vaccines comprising P53 epitope having a specified sequences, useful for treating and preventing cancer, the epitopic peptides is useful as diagnostic agents and for evaluating immune

The present invention describes isolated prepared P53 epitopes (I). Also described are: (1) a cytotoxic T lymphocyte (CTL) that is cultured in vivo and binds to a complex of (I); (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids; (3) a vaccine composition comprising (II), a unit dose of a peptide with less than 50 contiguous amino acids with 100% identity to the native peptide sequence of p53, and a pharmaceutical exciptent; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (II). (I) acid encoding (I); and (5) an isolated nucleic acid encoding (II). (I) are useful as diagnostic agents and for evaluating immune responses. Composition is useful for treating or preventing immune responses. Composition is bytopes, immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of the vaccine composition of (I). The ability to combine selected epitopes and
                composition of (I). The ability to combine selected epitopes and further, to modify the composition of the epitopes enhances the immunogenicity. The possible pathological side effects caused by infectious agents or whole pathological antigens, which might have their own intrinsic biological activity, are eliminated. AAG89363 to AAG89747 represent amino acid sequences used in the exemplification of the
                                                                                                                                                                                                                                                            Gaps
present in whole antigens can be avoided with the use of the vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Epitope-based vaccines comprising P53 epitope having a specified sequences, useful for treating and preventing cancer, the epitopic peptides is useful as diagnostic agents and for evaluating immune

The polypeptide is used to detect anti-p53 autoantibodies in a human patient. The antibody can be used to determine the post-translational modification state of a p53 protein. These are used especially in the diagnosis of cancer. The present sequence
            immunogenicity. The possible pathological side effects caused by infectious agents or whole protein antigens, which might have their own intrinsic biological activity, are eliminated. AAG89363 to AAG89747 represent amino acid sequences used in the exemplification of the
